1 INTRODUCTION

This annex provides tables of the collision risk modelling (CRM) input parameters for the Five Estuaries Offshore Windfarm (VE) and the collision mortality results obtained.

The input data comprise:

- Tables 1 to 18: densities of birds in flight in the VE Array Areas (North and South) in each month, presented as the mean, standard deviation and upper and lower 95% confidence range derived from 1,000 nonparametric bootstrap simulations (the monthly values were derived as the average of the two months available);
- Table 19: the Array Area and turbine data;
- Table 20: biometrics of each species modelled (e.g. wingspan, body length, etc.);

And the outputs are presented in:

- Tables 21 to 37: monthly collision risk for each species assessed using turbine parameter set 1;
- Tables 38 to 54: seasonal collision risk for each species assessed using turbine parameter set 1;
- Tables 55 to 71: monthly collision risk for each species assessed using turbine parameter set 2; and,
- Tables 72 to 88: seasonal collision risk for each species assessed using turbine parameter set 2;

For the avoidance of doubt, the avoidance rates used for CRM were those advised by Natural England¹, as follows:

• Gannet	99.72% - 99.88%
• Kittiwake	99.2%
• Herring gull, lesser black-backed gull, great black-backed gull	99.4%
• Little gull, common gull, black-headed gull	99.5%
• Tern species	99.0%
• All other species	99.0%

Nocturnal Activity Factors (NAF) used for CRM were the range advised by Natural England¹.
